

Homestead Assisted Living

Transcribed by [TurboScribe](#). [Go Unlimited](#) to remove this message.

What's this one? Warriors. Warriors? I'm like, it started like super surface level, like Google Sheets. If you're familiar, it's like Looker Studio.

Kind of like did stuff with that. But then over the last little bit, I've done Power BI. And it's awesome, like it works.

But it only has been working on the administrative side. I haven't been able to pull kitchen data, housekeeping data, activities, maintenance. Kind of just like making it up as I go.

So the admin side, I got it really down pat. That's where the whole Power BI is. We have a system.

I just download reports from our healthcare software. And just import right into it super cleanly. But everything else, it's just struggling to find something that can be like this cohesive, like all-in-one hub.

Even if the admin stuff is separate, because I have that figured out, that wouldn't be a huge deal. But at the same time, it would be awesome. Like we track a lot of like falls, patient documents, things that need to be updated like monthly, annually, 90 days, 180 days, so on and so forth.

Like if there was a place where I could put all that in there, because then we can be able to see if we get notified like, hey, this document is coming due in two weeks or whatever. So when I go and meet with the administrators, I can say, hey, this is what's coming due, like where are you at with it kind of thing. But that part needs the HIPAA compliance part, because I can't just have documents in there just floating around.

But if that one needs to be separate, everything else really doesn't need to be HIPAA compliant, because it's really just like menus, and I can just put room numbers. I can put like room 101 wants a tray, or room 102 wants to eat in the dining area. I don't necessarily put a name next to it.

But I've been using Claude to write like iOS apps. I'm not a coder. I'm kind of just figuring out as we go.

But it's been helpful, and it works. But I don't think because I'm not a coder, I can't, like there's glitches, like they come to me all the time. I need you to fix this.

I'm like, I can ask Claude. If Claude can't figure it out, then I'm not going to figure it out. So I'm kind of just faking it until I make it.

So it's been working for what we need. But with the new project we have coming, in a perfect world, I want to be able to sit down on my computer and just, I see everything from 30,000 feet,

and then I can give you that up. So what type of programs are you currently using? So we have the ECP, which is the health software.

Connect Team is our time in attendance, or our scheduler. And then we use iSolved for our payroll. So we take the timesheets from Connect Team and import those into iSolved, and that's how we pay our employees.

And then Google Sheets and Grove Menus is dining. That just publishes the menus for the week. So I was wondering, for your database, I was wondering, who's your vendor, and do you guys know if it would cost extra for API access to? Connect Team doesn't.

Connect Team's free. I think ECP's free. We had a meeting with them last week.

It's that REST API. Does that just mean that you only get, like, what's a REST API? They said it to me, and I just nodded my head like I knew what it was. I know I've worked with it.

I believe I need to double-check what it is. If I was to research it up, it would make more sense to me at the moment. Okay.

But I know I've worked with it a little bit in the past. Let me just refresh my browser. They made it seem like it was kind of just surface-level stuff.

I don't think it was going to go super deep into charting and stuff, but the reports that are already there it could pull, which is helpful. But there's so many other things that aren't necessarily reportable that we would want data on. Like, they have a, like, default list of, like, certain reports that are made.

But I want to be able to dive a little bit deeper than just the reports they give us because there's certain things that we want to look at. But they're going to get back to me on that one. So I'll save you time and energy.

They're going to get back to me, and I can figure that out for you. And then Cisco is our food delivery. That's where we can order, like, I want to be able to know, like, the cost per resident per day per meal.

Like, there's a certain number that we want to be able to make sure we're hitting. Like, that would be helpful to know. Sorry.

Is that something that you are already tracking? We do it. Yeah, but it's, like, it's manually. It's not super crazy because you just take the invoice total and you just divvy it out.

Like, it's not rocket science, but it is a manual thing that we track. Are you also tracking things like medical supplies that you're using? Yes. Okay.

And is that done manually, too? Yeah. So we have, that's also through Power BI. We just take that report, puts it in there, and can organize it by, like, plastic cups or gloves or tissues or whatever.

Yeah. But manually as well. Were you hoping this was, like, an app that, like, every employee can use and report? Like, certain things.

So, like, for the kitchen stuff, like, so we have nurses stations on each floor. Like, all I would need the staff to know is just to put in an order. Like, that's all I would need them to do.

They don't need to see anything else. So there's certain things that would just be strictly just, like, they would only see, like, one or two things. Everything else would really just be for me or the administrators.

Okay. And then, like, housekeeping, they just need to see the rooms that they have to clean. And then dining, the staff taking the orders would need to be able to use it.

And then, obviously, the kitchen would just need to be able to see those orders come through. So I was curious. Because I know one of the things about the HIPAA compliance was that if you had, like, date of birth, medication list, or simply their name in a room, that would make it HIPAA.

But if we didn't, if we took away the name, as what you were saying, is that something that you were plausible? Like, room this time? That's what we use right now. Yeah. So the system, once again, super cheap.

But all it is is just room number. So I just take a picture of the menu. It uses AI, uploads it, so it organizes, like, breakfast, lunch, and dinner.

And they're just putting in room number. So, like, room 101 wants this. Room 102 wants this.

That way you avoid all that. Okay. Yeah, that does make sense.

Because it costs so much to simply make your system HIPAA compliant. It's crazy. It's, like, \$500 to \$1,000 a month online.

What? That's just with the database or other, like... Like, we were looking into the HIPAA compliance things. And we have another group that is also working on, like, HIPAA stuff. Some things that they have to do to make it possible.

It's kind of crazy. It's a massive headache. Because, like, the CLOD thing, I use, like, \$100 a month.

And I'm like, this is awesome. It's \$100 a month, and it can, I mean, in a perfect world, it can do a lot of things for me. Yeah.

But then you look at trying to get the HIPAA side to it. And like you said, it's, like, because we use Supabase. Or I use Supabase as, like, the storage or whatever for it.

And then that's, like, \$600 plus the add-on fee plus all these other things to keep it. I'm like, that one was just not worth it. Yeah.

But we were hoping on maybe seeing if there were, like, certain pieces of information we could hopefully make a database using AWS. Like, Amazon Web Services to only have it for certain information. It might seem way more plausible and cheaper.

But it really depends on the API access and how we're able to get, like, only certain information. Because the less information you have, the more you can, like, actually personalize the database you create. But it really depends on how that works.

Sorry. Is that something that you would be okay with? Or were you hoping to have, like, all the information displayed? I don't know. It kind of depends.

So, like, the activities, housekeeping, maintenance, and dining, all that stuff does not need HIPAA compliance. And like I said earlier, the administrative stuff that does need it, I already have our system that works. So if that has to be separate, it's really not the end of the world.

Because ECP has, I think I showed you the other day, they have all these integrations. One of them already has the whole, like, HIPAA compliance stuff. And it can pull whatever data I want when I want it.

So it may just be that the administrative side is just a separate entity. That way we don't need to mess with that whole thing. But you, from, like, my understanding of what the confrontation is, you want a hub to connect all the other operations to make your job super efficient.

Okay. And to make the managers more efficient. Like, our housekeeping person is always in the basement, kind of like me, because she's doing so many, like, manual paper things.

And we don't want people in the basement. Same with our dining guy. He's always, like, trying to track certain things.

And we want him roaming the kitchens and, like, serving food and, like, being hands-on. The whole point of this is just to make everyone more hands-on. Instead of doing the daily, like, I want to be able to automate as much as I can.

Yeah. And I remember last time we met, one of the things that you really wanted to focus on were, like, the move-in, move-out. Yeah.

I guess that process. Does that require, like, HIPAA things? I don't think so. I've looked a lot into it because the most sensitive information we have on there is just a name and then a contact.

But if you think about it, like, you go to any other business, they're going to get your name and contact. Like, I don't need their address. It's just a phone number.

Yeah. So I personally, I could be totally wrong. I don't think that would be HIPAA compliant because I'm not putting their doctor.

I'm not putting any allergies. I'm not putting their meds on there. All I need to know is what their name is and then a contact person so we can call them.

And then everything else is just dates of, like, when we need to get an assessment done, when they're moving in, has the room been cleaned. Yeah. So I don't think that would be HIPAA compliant or would need to be HIPAA compliant.

Yeah. Because I believe it actually is since your building is under HIPAA, is HIPAA compliant. I believe simply just having your name and if they are living here and might actually be HIPAA compliant.

So if it's just those information, though, that's why we're hoping about, like, making an AWS database to make it, like, only those certain information is more, like, secure. I believe that's something we should be able to do, which is plausible. Yeah.

We will need to look a little bit more into it. Yeah. It's so fuzzy.

Yeah, it's been a little bit difficult because obviously the information that you want is pretty basic. Yeah. But because this is an assisted living center and it's under, like, the classification of a medical practice, there are a lot of things that we need to consider when creating it.

And, like, we've been talking with a couple of people and also Claude because he knows a lot of information. But it's a little, like, gray in the area. And so we're trying to find ways to work around that.

Yeah. Now that we know the system and, like, if we were to talk more further in depth, I believe we should be able to make something for the parts that you're talking about that isn't HIPAA compliant. Yeah.

And once we get that running and, like, we've researched way more into the HIPAA compliance with the information, I believe we should be able to move forward with creating something for that part as well. Is the AWS, like, a website and then there would be an app? Or, like, what are you guys thinking? Like, is there, like, a web-based thing or is there going to be a phone app and a website thing? Well, you can create a website and an app. AWS is simply just a cloud service like Amazon Web Services, which allows you to, like, there's a lot of things you can do on Amazon Web Services.

Like, I was in a society where we were just trying to figure out how to navigate through it. Very

complex. Like, if you've ever gone in, you're, like, just overloaded with tons of stuff you can do.

Well, it's also very helpful because then you can make basically a database to help be HIPAA compliant, I believe. It was, like, a little fuzzy when I was talking about that process, but I believe there is a way to work around it. Okay.

But it's a pretty big service. There's a lot of stuff you can do with it. It's just, like, so much information and it takes a lot of learning and figuring out how to create it.

For sure. Okay. Cool.

You mentioned talking about events and things that were running here. Would you like that integrated in as well so you could see a list of upcoming things and you can plan ahead? That would be awesome. Yeah.

I was also wondering, you said you already have these existing softwares. Did you want to make a whole new software that, like, does everything for you? Or were you hoping for a software that connects to these softwares that's already existing to them? If my stuff worked, I would love it. But it's so hit or miss if it works, and I don't want to put all my eggs in one basket and then have everything connect to the thing that I made, and it's just spotty.

So I don't know. I'm, like, trying to fine-tune it right now. I'm trying to get it figured out.

So I don't have an answer for you yet. No, that's okay. So but I think in a perfect world, because I, like, I know all the nitty-gritty on every single thing for every department, and it's all built in the app.

Yeah. It's just getting it to work appropriately. And if it works appropriately, it would be awesome just to sink everything into one spot.

That would be awesome. Do you – so on the apps that you've already created, is there, like, any personal data or anything? Because I was just wondering because we were thinking that we could kind of look at what you've had. Yeah.

Right now it's just a housekeeping one that I have. Yeah. The other one – are you familiar with Base 44? Yes.

Okay. Yeah. It's janky, but it got the job done for me.

That's what we use for the kitchen stuff. I don't even know if I can get you in there right now. It's, like, so hit-or-miss.

Yeah. I can't even pull – I used to be able to pull reports to be, like, how many to-gos and how many people ate in the diner and all that stuff. I don't get any of that anymore.

But really the housekeeping one I can send you no problem. Okay. Definitely.

And then is there, like – what parts of the housekeeping app is, like, so hit-or-miss? It's just, like – let's see. What was it called? It's just, like, random glitches. So, like, they have, like, 20 minutes to clean a room.

And so, like, they'll start – they'll hit, like, start room clean, and then they'll finish it, and then it will mark that it was done. And then, like, two seconds later it glitches and says not completed. And so, like, the staff are going back, and they're like, well, I did this room, but it said I didn't do it.

Or they finished a room, and it took them, let's say, 17 minutes to do it. The timer clears and says it took them two minutes. So it throws off, like, the average times and stuff.

So – but those are the only glitches that I know of right now. But they're kind of important because that housekeeping director needs to be able to hop on and be like, okay, these are the rooms that got completed. This is what's left to be done.

But then when she hops on there, it's still showing, like, all the rooms haven't even been started yet. Yeah. So then she has to go back and say, did you finish this room? Did you finish this one? Stuff like that.

But it's, like, only on certain phones, which doesn't make sense. I don't know how some phones work and other phones don't. Really? Have you spoken to other health care providers or care home facilities about software they use? A little bit.

There's some in – there's Morningstar in Idaho Falls. They don't have a housekeeping thing. Like, no one – in regards to housekeeping, no one has a housekeeping app.

So I'm like, really? I'm on a generational run. I could do this and I could sell it. But I've got to get mine to work first before I can even do that.

But there's not, like, a – no matter – because there's, like, hotels. Like, the next closest thing to this is, like, hotel cleaning. You go in, find a room, clean it, you're out of there.

But all of them, like the Marriott over here on the other side of town, they just have their own internal thing. Like, it's not – a lot of these companies just have their own internal stuff. But we're a family-run business.

So, like, we don't have the resources like all these other massive companies do that generate crazy money. They can afford to create their own hub internal system that works for them. And that's ideally where I'd like to go just because of how big – like, once this new project is built, we're probably going to do another one at some point.

Like, it's just going to keep – it's just going to keep getting bigger. So I want to try to be ahead of it

so we can just – we have the foundation for every new building that comes. And it's just – it's streamlined.

It's just one less thing you've got to worry about. It's like if you go to any random Chick-fil-A, they're all ran the same. It's not that hard to start up because everyone knows what's expected, what you say, the procedure, policies, all that kind of stuff.

It's kind of what I want to do here is anytime a building is built, you just throw people in there and they know exactly what they're supposed to do. So that's the dream. Well, the UNHIPA compliance stuff does seem very feasible.

We'll hopefully try to look into a C building. Hopefully by maybe next week we should have a prototype built up if you would like to see that. Yeah, I'd love to see it.

And then we can also look into the HIPPA compliance stuff. We'll definitely need to talk to your vendor as well and see what that API access is looking like. But – Yeah.

Yeah, I'd love to see it and we can go from there. Kind of like I told you, Ben. Yeah.

I will – if I see it and if it's going to work and we can work on price appropriately, we'll definitely have the conversation. All the owners are all for this. Because like I told you, I'm just stuck in the basement all the time.

Like I need – same thing that I'm trying to get the housekeeping and dining personnel, I need to be able to get out of my office too and roam around. So if it makes sense, all for it. If it's too much, it might be one of those things where we just have to wait a minute until stuff settles down and then we do it.

Definitely. But yeah, that would be awesome. Yeah, sorry.

I just have one more question on my end and it is on the specifications for the different groups. So obviously the kitchen has a couple requirements that you need and the housekeeping. Is it possible for you to like pull up a list of the things that you specifically want in each of the apps? Yeah.

Okay. I can do that. Yeah.

We'll probably need that just to have kind of idea of where we're going. Yep. And then build around that.

I'll just give you the key stuff. Okay. It doesn't need to be super nitty-gritty.

I don't want to take too much of your guys' time. But like I'll put the big stuff in there. Okay.

And then, yeah, I can do that. No problem. Are you just going to make like a document and send

it to people? Yeah.

I'll just text it to you. Yeah, that sounds great. That would be perfect for us.

And is there a place you want us to start? So for example for the cleaners, if we start with that and then we've kind of got a base to build on, you go, oh, yeah, this is great actually. Yeah. Housekeeping is probably the most important one.

Housekeeping and dining. Yep. The other one, like activities and life or death.

Sure. That's kind of like a need. Same with maintenance.

So like housekeeping and maintenance – or sorry, housekeeping and dining would be the most important ones. Okay. What specific parts in dining? I know you guys said like you wanted to count like the gloves and how much people you end up serving.

Are there any other like categories there? There would be like a cleaning – or like a kitchen checklist, like end-of-shift checklist. So like knowing what time the meals got served, like recording temperature logs for like the fridges because we've got to be in compliance with the state. So there needs to be a spot to put like recorded fridge temps for each shift.

Let's see. That's pretty much all the big ones. Oh, the biggest – the one other thing is like a – like some sort of satisfaction survey.

So like right now I have it set up like the staff after each meal, they'll go around and be like, hey, how was the steak and potatoes today? And they just hit like a thumbs up or thumbs down. But that way I'm able to see which meals are constantly getting dislikes. So that way we don't serve that meal anymore.

So you don't want like anything complex, just a thumbs up, thumbs down? Thumbs down. Yeah, thumbs up, thumbs down. Seems pretty sweet.

Yep. OK. Would you like us to connect to your already made survey or do you want to just like make another survey and just like collect all that – those responses and like put it – I don't even know if mine is working right now.

It was working when I first made it. I don't even think it's working anymore because I haven't been able to pull stuff in like two weeks. That's probably why they're a little grumpy.

Oh, OK. That they get certain foods, but – OK. OK.

I think as long as you can get the checklist of things that you want specifically – Yep. I can do that today. OK.

That sounds perfect. I think we can start moving forward and make a prototype for you. I'll make

the list and then just call me if you guys got any questions on anything.

Awesome. That sounds perfect. I'm going to go from there.

OK. That sounds great. Thank you very much.

Thank you. Appreciate it. Thank you for your time.

Thank you. Oh. OK.

Bye. Bye, Logan. OK.

Awesome.
